# Homework 1

#### Li Zikang

# 2-5

(a) Write donw a recursion for  $f^{(n)}(x)$  in terms of  $f^{(n-1)}(\cdot)$  and the parameters of the problem.

For any participant, with n more spins, he/she can choose to spin or stop. When choosing **stopping**, he/she will take away the current accumulation of x. We can obtain  $f^{(n)}(x) = x$ . While choosing **spinning**, it is also easy to know that

$$f^{(n)}(x) = \sum_{i} f^{(n-1)}(x + r_i) \cdot p_i$$
, where  $i = 1, \dots, m$ .

$$f^{(n)}(x) = \max\{\sum_{i} f^{(n-1)}(x+r_i) \cdot p_i, x\}$$

(b) Solve the problem numerically for the case in which  $m=3, p_i=1/4$ , for  $i=1,2,3, r_1=1, r_2=5, r_3=10$ , and there are one or two more spins available.

At the beginning, the winning is 0, so must choose to spin.

$$f^{(2)}(0) = \begin{cases} f^{(1)}(1), \text{ probability } 1/4\\ f^{(1)}(5), \text{ probability } 1/4\\ f^{(1)}(10), \text{ probability } 1/4\\ 0 \quad \text{ probability } 1/4 \end{cases}$$

$$f^{(1)}(x) = \begin{cases} x + 1, \text{ probability } 1/4\\ x + 5, \text{ probability } 1/4\\ x + 10, \text{ probability } 1/4\\ 0 \quad \text{ probability } 1/4\\ x \quad \text{ choose to stop} \end{cases}$$

So when spinning once, the excepted winnings are  $1/4 \times (1 + 5 + 10) = 4$ . And when spinning twice,  $f^{(1)}(x) = 1/4 \times [(x+1) + (x+5) + (x+10)]$ .  $f^{(2)}(0) = 1/4 \times (f^{(1)}(1) + f^{(1)}(5) + f^{(1)}(10)) = 1/4 \times (4 + 3/4 + 4 + 15/4 + 4 + 30/4) = 6$ 

In particular,  $f^{(0)}(x) = x, f^{(1)}(x) = \max\{3/4x + 4, x\}$ . Let 3/4x + 4 = x, x = 16. When x > 16, the participant will take away the winnings; when x < 16, the participant will spin again. Consequently, the expected total winnings are 16 for this case.

# 2-6

(a) Write down a recursion for v(x) and use it to find an explicit expression for v(x) in terms of  $x, \Phi(x), I(x)$ , and  $\alpha$ , where  $I(x) := E(X - x)^+ = \int_x^{\infty} (\xi - x) \phi(\xi) d\xi$ .

$$v(x,n) = v(x,n-1) \cdot \alpha \cdot \Phi(x) + \int_x^\infty \xi \phi(\xi) d\xi$$

Let 
$$V = \int_{x}^{\infty} \xi \phi(\xi) d\xi$$
.

$$v(x,n) = v(x,1) \cdot [\alpha \cdot \Phi(x)]^{(n-1)} + V[1 + [\alpha \cdot \Phi(x)] + [\alpha \cdot \Phi(x)]^{2} + \cdots + [\alpha \cdot \Phi(x)]^{n-2}]$$

$$v(x,1) = \int_x^\infty \xi \phi(\xi) d\xi = V$$

Then we can obtain that  $v(x) = V \frac{1 - (\alpha \cdot \Phi(x))^n}{1 - \alpha \cdot \Phi(x)}$ ,  $\alpha \in (0, 1)$ . Because this is an infinite period, let  $n \to \infty$ , so  $v(x) = \frac{V}{1 - \alpha \cdot \Phi(x)}$ .

$$I(x) = \int_x^{\infty} (\xi - x)\phi(\xi)d\xi = \int_x^{\infty} \xi \phi(\xi)d\xi - x(1 - \Phi(x))$$

So  $V = I(x) + x(1 - \Phi(x))$ , substitute it in the v(x), we get  $v(x) = \frac{I(x) + x(1 - \Phi(x))}{1 - \alpha \cdot \Phi(x)}$ 

(b) 
$$\alpha = 0.99$$
 bids  $\sim N(1000, 200)$ .  $x = 1200$ . So  $v(1200) = \frac{I(1200) + 1200(1 - \Phi(1200))}{1 - \alpha \Phi(1200)}$ ,  $I(1200) = 200I_N(1)$ ,  $\Phi(1200) = \Phi_N(1) = 0.841$ ,  $I_N(1) = \phi_N(1) - 1 + \Phi_N(1) = 0.083$ . By calculating  $v(1200) = 1238.9$ 

By calculating, v(1200) = 1238.9

#### 2-7

(a) Display  $\Omega$ .

$$\Omega = \{(3,3,1), (2,3,2), (2,2,2), (1,3,2), (2,3,1), (0,3,2), (1,3,1), (1,1,2), (2,2,1), (2,0,2), (3,0,1), (1,0,2), (2,0,1), (1,1,1), (0,0,2)\}$$
(b)  $S_0 = \{(3,3,1)\}, S_1 = \{(2,3,2), (2,2,2), (1,3,2)\},$ 

$$S_2 = \{(2,3,1)\}, S_3 = \{(0,3,2)\},$$

$$S_4 = \{(1,3,1)\}, S_5 = \{(1,1,2)\},$$

$$S_6 = \{(2,2,1)\}, S_7 = \{(2,0,2)\},$$

$$S_8 = \{(3,0,1)\}, S_9 = \{(1,0,2)\},$$

$$S_{10} = \{(2,0,1), (1,1,1)\}, S_{11} = \{(0,0,2)\}.$$

$$m = 11.$$

#### 3-4

(a) Write down a recursion for  $f^n(x|S)$ .  $f^{(n)}(x|S) = \sum_{i} f^{(n-1)}(x + r_i|S) \cdot p_i.$ 

$$f^{(n)}(x|S) = \begin{cases} \sum_{i} f^{(n-1)}(x + r_i|S) \cdot p_i, \text{ spin or } x < S. \\ x, \text{ stop.} \end{cases}$$

(b) Being indifferent means  $\sum_{i} f^{(n-1)}(S + r_i|S) \cdot p_i = S = f^{(n)}(S|S) \Rightarrow \sum_{i}^{m} (S^* + r_i)p_i = S^* \Rightarrow S^* = \frac{\mu}{p}.$ 

# 3-5

(a) Write a recursion for  $f_n$  in terms of  $f_{n-1}$ 

$$f_n = f_{n-1} \cdot \alpha \cdot \Phi(\alpha f_{n-1}) + \int_{\alpha f_{n-1}}^{\infty} \xi \phi(\xi) d\xi$$
  
Let  $V = \int_{\alpha x}^{\infty} \xi \phi(\xi) d\xi = I(\alpha x) + \alpha x (1 - \Phi(\alpha x)).$ 

(b) Calculate  $f_n$ .  $I_N(-0.05) = \phi_N(-0.05) - 1 + \Phi_N(-0.05) = 0.398 - 1 + 0.48 = -0.122$ .

$$V = I(990) + 990(1 - \Phi(990)) = 200I_N(-0.05) + 990(1 - \Phi_N(-0.05)) = 200 \times (-0.12) + 990(1 - 0.48) = 490.5$$

$$f_2 = \alpha \mu \Phi(\alpha \mu) + \int_{\alpha \mu}^{\infty} \xi \phi(\xi) d\xi = 0.48 * 0.99 * 1000 + 490.5 = 965.7$$
  
$$f_3 = \alpha \Phi(\alpha f_2) f_2 + \int_{\alpha f_2}^{\infty} \xi \phi(\xi) d\xi = 916.5$$

$$f_4 = \alpha \Phi(\alpha x) f_3 + \int_{\alpha x}^{\infty} \xi \phi(\xi) d\xi = 843.3$$

(c) Let  $f_n = f_{n-1}$ , we can obtain that  $f_n = \alpha f_n \Phi(\alpha f_n) + I(\alpha f_n) + \alpha f_n (1 - \Phi(\alpha f_n))$ . Obviously, we can obtain that  $f_n = \frac{I(\alpha f_n)}{1 - \alpha}$ .

### 3-6

(a) Because there is a discount factor which is less than 1, when you wait it for a long period, your profit will be very low as time went by. So, it is obvious that we don't need to wait for all bids to be received.

(b) 
$$f_n(x) = \begin{cases} \alpha f_{n-1}(x + r_i) \cdot p_i, \\ x, \text{ accept.} \end{cases}$$

To be honest, I'm confused by this question....

#### 4-4

The original formulation is 
$$v(x,S) = \begin{cases} c & \text{if } x = 0 \\ px + qv(x-1,S) & \text{if } 1 \leq x \leq S \\ v(S,S) & \text{if } S < x \end{cases}$$

for this case, we can continue drive until we find an space. So define a function F(x), f(x,i), where x < 0.

$$F(x) = pf(x,0) + qf(x,1) \text{ and}$$

$$f(x,i) = \begin{cases} -x & \text{if } i = 0\\ F(x-1) & \text{if } i = 1 \end{cases}$$

i = 0 means the space isn't occupied, only choose to park here.

Now, we can obtain 
$$F(x) = p(-x) + qF(x-1) = p(\sum_{i=-x}^{n-x-1} iq^{i+x}) = \frac{q[1+(n-1)q^n - nq^{n-1}]}{(1-q)^2} - x\frac{1-q^n}{1-q}, x < 0, \text{ let } n = \infty, F(-1) = \frac{1}{(1-q)^2}$$

Let v(0,S) = F(-1), we can obtain the formulation for this question:

$$v(x,S) = \begin{cases} v(0,S) = \frac{1}{(1-q)^2} & \text{if } x = 0\\ px + qv(x-1,S) & \text{if } 1 \le x \le S\\ v(S,S) & \text{if } S < x \end{cases}$$
Consequently,  $v(S,S) = p \sum_{i=0}^{S} q^i(S-i) + q^S \frac{1}{(1-q)^2} = 0$ 

 $S - \frac{q(1-q^S)}{n} + q^S \frac{1}{(1-q)^2}$ .

#### 4-5

Define 
$$G^{n}(x) = -x + \sum_{i=1}^{m} f^{n-1}(x + r_{i})p_{i}$$
.

The derivative of  $G^n(x)$  equals  $(-1 + \sum_i^m f'^{n-1}(x+r_i)p_i)$ , because  $f^{n-1}(x+r_i)$  is a linear function of x, and the coefficient of x is 1. So  $\sum_i^m f'^{n-1}(x+r_i)p_i = \sum_i^m p_i = 1-p < 1$ . So the derivative of  $G^n(x)$  is less than 0. Therefore,  $G^n(x) < G^n(x+1)$ . According to Exercise 3.4, the decision rule we decided is indeed optimal.
